

Aerial™ Care Coordination

What if you had real-time clinical decision support tools to close gaps in care, improve clinical outcomes and maximize STAR bonus revenue?

Skyrocketing healthcare costs, disparities in outcomes and an imminent sea of change in reimbursement policies are among the dynamic forces driving Population Health Management (PHM). As PHM itself represents a new care-delivery model, safely navigating the collective turbulence presents a significant challenge for healthcare organizations today.

The Aerial Care Coordination® application was designed to help organizations achieve successful clinical integration, care coordination and patient population management with real-time clinical decision support tools and sophisticated population and care analytics. These resources are available for physicians and clinicians at the point of care and all constituents across the care chain, helping them gain meaningful, actionable clinical insight and guidance to increase quality of care and decrease costs.

Proactively manage quality and cost of care with analytics-driven Clinical Decision Support tools. Meaningful, actionable, clinical insights are available to clinicians at the point of care and across all care settings. Manage population health with sophisticated rules engines that analyze clinical data to identify at-risk and rising-risk patients.

Aerial Care Coordination's comprehensive workflows and tools enable organizations to manage the following:

- Ensure providers, medical administrators and patients receive gaps-in-care alerts for Star, HEDIS, P4P and other chronic and prevention-based programs.
- Incorporate and refer to a full range of lab, pharmacy, authorizations, diagnosis and procedure information into their daily care delivery workflows.
- Leverage robust HCC capabilities for risk adjustment of chronic populations to minimize revenue loss associated with undercoding.
- Customize the reporting suite and measures so they are relevant to your specific business needs, with real-time, actionable information and "drill-down" capability for detailed analysis.

Just one of many apps in Medecision's state-of-the-art Aerial Population Health Management portfolio, Care Coordination helps organizations of all shapes and sizes drive clinical and financial success.

Aerial Care Coordination connects interdisciplinary care teams and integrates with community-based EHRs to help organizations more efficiently manage and deliver care.

Learn more about how Aerial can help you manage clinical and financial risk with confidence.
