# aerial™

Aerial™ CarePlanner 360

What if you could manage care anywhere and anytime, engaging with members and/or patients in the field or any other setting, offline or on?

CarePlanner 360 incorporates next-gen analytics-driven insight to identify high-priority topics or areas of focus which provide the care manager with the flexibility to work on those that are important to the patient and build a care plan accordingly. Based on the topics, evidence-based problems, goals and interventions are also recommended and can be tailored for the individual. This information is adjusted as new data is available so that the care manager is informed real time as to the status of the member.

The application also has an option to enable in-field assessments and care plans with online / offline sync and in-field printing support. This enables care managers to serve members and patients whenever and wherever they are, regardless of the Internet coverage in a member or patient's location.

CarePlanner 360 delivers evidence-based recommendations for care plans tailored for the whole individual — not just a condition — & new recommendations can occur, based on new data.

aerial™

CarePlanner 360 is one of a growing list of applications powered by Medecision's Aerial Insights™, an advanced analytics and cognitive intelligence solution for data aggregation, enhancement, and visualization.

The powerful CarePlanner 360 application incorporates:

- An intuitive interface and visualizations that drive focused interaction with the member.

- Streaming analytics that dynamically incorporate newly identified insights, and any re-prioritization, into the care management workflows.

- Robust, systematic and always up-to-date evidence-based clinical content that promotes more accurate decision making.

- An interactive model that promotes clinical and member-centric discussions that focus on the members' most immediate needs.

- Auto-recommended problems, goals and interventions, which promote efficiencies, more targeted consumer conversations and improved outcomes.

- Capability for remote sync, which eliminates tedious manual re-entry of data, improves efficiency, and adds additional value to field visits.

- Option for state Medicaid custom questionnaire support.

With CarePlanner 360, organizations can:

- Leverage highly trained, scarce nursing resources to optimize patient and member outcomes.

- Utilize analytics to significantly reduce the cost of care for cross-condition co-morbidities.

- Improve the consumer experience to change behavior and increase compliance with the plan of care.

Promoting both precision and comprehensiveness, CarePlanner 360 provides cross-condition, holistic assessments and auto-generated recommendations for plans of care. NCQA and URAC compliant, these assessments and care plans are patient-centered, considering multiple conditions together.
