

Aerial InCircle™

Leverage real-time, proactive communication for coordinated, collaborative care

Collaborative care is a cornerstone of population health management and effective, efficient care delivery. However, true collaboration is thwarted by the complexities inherent not only in high-risk populations but also the sheer number of caregivers and providers involved in any patient's journey to recovery, health maintenance and wellness.

This situation is exacerbated by challenges involved in patient engagement, that is, getting patients to take the active role in their healthcare that is so vital to an optimal clinical outcome. Whether they feel the information they get is too generic, too much, too complicated or too hard to access, the task of getting involved may seem more difficult than it is worth.

The remedy to these roadblocks can be found in effective communication among all parties. And today that is possible with Medecision's Aerial InCircle™ mobile app, which operates in real time to connect everyone in the care circle – including the patient.

InCircle is a social-mobile platform that helps:

- Patients manage their health effectively through collaboration with their care team and caregivers and access to real-time information and insight into their health.
- Care managers and coordinators drive the level of patient engagement that creates meaningful, productive relationships.
- Healthcare organizations lower the cost of care, improve clinical outcomes, and enhance patient safety and satisfaction.
- Clinical teams make more informed decisions through virtual information-sharing.

Aerial InCircle™ is an easy-to-use and familiar technology that helps patients and their care teams communicate and collaborate across disciplines and venues.

Empowering the clinical team

InCircle creates a highly collaborative environment across care settings, enabling more effective management of high-risk patients and improving outcomes across populations.

This Medecision solution:

- Personalizes the care experience to connect patients, physicians, extended care team members, social workers, family members and community services.
- Facilitates interaction between the care team member and care manager virtually any time, enabling the clinician to stay in the loop on all relevant information and activities.
- Provides secure and HIPAA-compliant communications and information exchange.
- Enables calls from the clinician to patients and their care managers directly from the app.
- Gives clinicians the ability to review photographs shared by the patient.
- Helps the care manager to effectively coordinate care with multiple providers, keeping everyone up to date and scheduling appointments, if needed.
- Enhances patient safety and satisfaction.

Aerial InCircle™ enables care team members with capabilities that are beyond those of patient portals, which are limited to interactions with patients only. With the InCircle app, clinicians can interact with the patient's care manager and other members of the care team, while the care manager plays the key role of coordinating all activities.
